United States Marine Corps Aircraft Since 1913 Dec 01 2020 Among the world's military air arms, United States Marine Corps Aviation occupies a unique tactical niche. As the air component of a combined-arms expeditionary force, it exists primarily to support Marine combat forces on the ground in their amphibious assault mission. From the "Banana Wars" of the 1920s to the present day "War on Terror," Marine aviation has undergone a lengthy fine-tuning process not only in terms of warfare doctrines and tactics, but also in the types of aircraft needed to accomplish the mission. This comprehensive survey provides the history, technical specifications, drawings, and photographs of every type of fixed and rotary-wing aircraft used by Marine Air from its origins prior to World War I up to current operations.

The Jet Engine Aug 09 2021 The Jet Engine provides a complete, accessible description of the working and underlying principles of the gas turbine. Accessible, non-technical approach explaining the workings of jet engines, for readers of all levels Full colour diagrams, cutaways and photographs throughout Written by RR specialists in all the respective fields Hugely popular and well-reviewed book, originally published in 2005 under Rolls Royce's own imprint

The Secret Horsepower Race Aug 21 2022 The piston engines that powered Second World War fighters, the men who designed them, and the secret intelligence work carried out by both Britain and Germany would determine the outcome of the first global air war. Advanced jet engines may have been in development but every militarily significant air battle was fought by piston-engined fighters. Whoever designed the most powerful piston engines would win air superiority and with it the ability to dictate the course of the war as a whole. This is the never-before-told story of a high-tech race, hidden behind the closed doors of design offices and intelligence agencies, to create the war's best fighter engine. Using the fruits of extensive research in archives around the world together with the previously unpublished memoirs of fighter engine designers, author Calum E. Douglas tells the story of a desperate contest between the world's best engineers - the Secret Horsepower Race.

Design and Development of a Hydraulic System for Outboard-engine-powered-commercial-fishing Boats Dec 21 2019 A hydraulic power-take-off was designed and built for outboard engines typical of those used on small boats and Pacific City-type dories. An associated hydraulic system was developed for use on these boats to provide power for fishing machinery. The power for each system was provided by a hydraulic pump direct-drive coupled to the outboard engine crankshaft at the flywheel. Four 1970 model outboard engines were used during the project for the design and testing of these systems. These engines were: a 40 hp and a 60 hp Johnson, a 50 hp Mercury, and a 55 hp Fisher- Pierce Bear cat. A concurrent effort involved the design and development of light-weight hydraulically-powered salmon gurdies especially configured for use on small boats and dories. Four Pacific City-type dories, each equipped with one of the above engines and its associated hydraulic system, were tested throughout the 1970 summer salmon commercial fishing season on the Oregon Coast. These boats logged a total of 2725 hours of operating time during the season and accumulated gross earning of approximately \$27,200. This is an average production of \$8.50 per operating hour versus an average production of \$5.50 per operating hour for such boats equipped with hand-powered gurdies. Subsequent analysis of operational data, engines, and hydraulic system components support the conclusion that a reliable, efficient, and relatively inexpensive hydraulic power-take-off system for outboard engines to power on-board fishing machinery is definitely practical.
